Annotation: *This article discusses about the problems that are often noticed in public schools and an appropriate decisions that can be made to prevent or decrease the amount of issues in educational establishments.*

Key words: *classroom, bullying, technology, size, parents, enormous, pupils, choice, school, maintain relationship, academic, teachers, research, problematic, family, educational, factors.*

Classrooms are actually bursting at the seams in many parts of the nation. Due to significant funding reductions, the school system was forced to eliminate all class size restrictions in order to accommodate students and the faculty that it could still afford to retain. Numbers in the classroom are frequently impacted when money is short. However, if the class size is greater than roughly 30, most professors concur that they cannot teach every kid in the room successfully. Their claims are supported by academic research. Smaller class sizes seemed to be particularly advantageous for male students, students from underrepresented groups, and students living in poverty. That's why, the choice of making small classrooms would be an appropriate option that can contribute to have an individual approach to each student. It is better to have a small classroom size and smart people rather than an enormous one that will be problematic to each school pupils to comprehend the material. The main reason is that teachers can more easily keep control, discipline and give more attention to each student.

Apart from that, the ability of a teacher to instruct kids is influenced by family issues as well. Both principals and educators concur that a student's motivation to learn will be impacted by what happens at home. Every day, a student faces hurdles at school such as divorce, single parenting, poverty, violence, and a host of other problems. Even though some educators make an effort to work with kids in less than ideal home environments, they are typically unable to achieve much since parents are frequently unwilling to collaborate with the schools to care for the children. The early skills and later educational outcomes of children are significantly influenced by family-related factors, such as the educational level, values, and expectations of the parents. Additionally, parents give their child a broad mathematical and early literacy input in addition to other learning environments. Your youngster will learn how to trust, make friends, and find comfort in others through this socializing with family. In general, we need to develop the ability to form and maintain relationships. With the family, these talents are established and developed.

Furthermore, bullying is not a new issue, but it has a significant influence on many children's ability to learn today. Through social media, texting, and other virtual exchanges, technology has offered bullies additional ways to afflict their victims. This startling percentage is especially shocking in light of the numerous negative effects bullying may have on students' wellness. Targeted children frequently struggle with academic underachievement, sleep problems, anxiety, and despair. Not to mention the bullies themselves, who are significantly more likely to experience a wide range of problems that could persist throughout adulthood, from violent conduct to drug dependence.

However, where is the problem, there is a solution.

Rewarding positive behavior is a key to reducing this problem. It's simple to call out a student when they do something wrong, especially if they always seem to be in problems. Due to the expectation of excellent behavior, few people opt to reward it. This is a difficulty. Catching a child acting good while they are constantly getting into trouble is beneficial and motivating. A positive behavior is acknowledged and reinforced by pointing it out. The learner will be more inclined to repeat the positive conduct in this manner. Reinforcing excellent behavior will provide kids clear expectations about what you want in a positive way, just as making clear rules and enforcing those laws.

Another issue is that today's students are often more digitally savvy than many teachers, giving teachers a distinct disadvantage in the classroom. However, a student's passion for technology can also cause him to procrastinate on his academic work. When education and technology are combined, it can be challenging for teachers to hold students' interest and attention long enough to effectively teach new concepts when they lack the technological know-how to compete with such devices. To meet the needs of 21st-century learning, technology must be used in the classroom. For schools that are already limited for funds, finding the money to integrate computers and other types of technology into their classrooms may seem like an insurmountable obstacle.
